ABSTRACT

Ecological damage has increased day by day and if the value of the ecology continues to erode in the next ten years at the same pace, man may not be able to enjoy his life the way he is now. Man continues to harm the ecology because he does not have to pay for it; likewise, man does not have the excitement to save the ecology because he does not get paid for it. One of the ways to reclaim the ecological loss is to assign a monetary value to the damage caused to the ecology, and the value added to the ecology. With this as a background, the study looks into the significance of Ecology Pricing and Ecology Cess as well as their feasibility, and the need for ecological investments for future ecological returns. The study also looks into the necessity to create a separate pool of fund to sustain - ability, to enrich biodiversity, and to maintain ecological balance. Since there has been a decline in the growing stock of trees, the study also includes a brief study of forest cover. The findings and recommendations will be of great use to the private sector, public sector, government, and the civil society at large.
